

AWS Solution Developed: Cloud Deployment for Real-Time Chat Application

Project Title: Cloud Deployment of a Real-Time Chat Application using AWS

Overview: Contributed to the deployment of a production-grade real-time chat application on AWS. The application followed a microservices architecture and leveraged Docker and Kubernetes for containerized deployment, enabling scalable, reliable, and cloud-based application hosting.

Technologies Used:

- AWS
- Docker
- Kubernetes
- Node.js
- React
- Redis
- Nginx
- GitHub Actions
- Jenkins

Key Features:

- Deployed a microservices-based application in a cloud environment.
- Integrated Docker containers with Kubernetes for scalable deployment.
- Enabled reliable application hosting with cloud infrastructure.
- Automated build and deployment through CI/CD pipelines.
- Supported secure, high-performance real-time communication.

My Contribution:

- Assisted in deploying the application on AWS.
- Integrated Docker and Kubernetes into the deployment workflow.
- Configured automated CI/CD pipelines for cloud deployment.
- Verified application functionality and deployment stability in the cloud environment.

Outcome: Successfully deployed a scalable real-time chat application in a cloud environment using AWS, improving deployment reliability, portability, and application scalability through containerization and orchestration.
